

Senior Swing™ The automatic door operator with Function Selectable Convenience

There are automatic door openers, and then there's Dor-O-Matic's Senior Swing, an ADA operator with a control box that's "smarter" than most. The Senior Swing operator utilizes microprocessor control with various switches and settings that can be adjusted and fine-tuned after installation to address actual traffic patterns.

Function Selectable Convenience is just one of the features that reside within the Senior Swing control box. This feature controls the amount of time the door remains open to accommodate different traffic patterns. For example, FSC Function 0 provides a time delay of 2 to 30 seconds with push plate activation and one second for Push N'Go. This is the normal setting as programmed at the factory. It is generally the preferred time because it limits the time a door is open and conserves heat and cooled air.

FSC Function 1 allows a selectable time delay anywhere from 2 to 30 seconds on both push plate and Push N'Go. Doctor's offices, hospitals and public facilities used by people who may take longer to clear the entrance may want to extend the opening time. With Function Selectable Convenience, you have a choice!
